4.12.2024

Trusted Computing and Multilevel Security

5

5

### Outline

- Bell-LaPadula Model (BPL)
- Other Formal Models
- Trusted Systems
- Multilevel Security
- Trusted Computing

4.12.2024

Trusted Computing and Multilevel Security

6

6

## Motivation for Formal Model

### Two fundamental security facts:

- All complex **software** systems **have bugs or flaws**
- **Difficult** to build a computer hardware/software system **not vulnerable** to security attacks.

### For example, Windows NT OS

- Introduced in early 1990
- **Promised** to have **high** degree of **security**
- Did **not deliver** on this **promise**
- Has wide range of security **vulnerabilities**

4.12.2024

Trusted Computing and Multilevel Security

7

7

## Motivation for Formal Model

- **Problems** to provide strong security involve both **design** and **implementation**.
- Hence, there is **desire** to **prove** design and implementation that satisfy **security requirements**.
- Thus, develop **formal models of computer security** to verify security **design and implementation**

4.12.2024

Trusted Computing and Multilevel Security

8

8

## Bell-LaPadula Model

- The most **influential** security model
- Developed in the 1970 as a **formal model** for **access control**
- Each subject and each object is assigned to a **security class**
- Security classes form a **strict hierarchy** (security levels)
  - top secret -> secret -> confidential -> restricted -> unclassified
- A **subject** has a security **clearance** level
- An **object** has a security **classification** level
- Classes **control** how subject may **access** an object

4.12.2024

Trusted Computing and Multilevel Security

9

9

## Bell-LaPadula Model

### Access modes

- **Read**: subject is allowed **only read** access to object
- **Append**: subject is allowed **only write** access to object
- **Write**: subject is allowed **both read and write** access to object
- **Execute**: subject is allowed **neither read nor write** access to object but may invoke the object for **execution**.

4.12.2024

Trusted Computing and Multilevel Security

10

10

## Bell-LaPadula Model

- **Multilevel security**: it has **multiple categories** or levels of data.
- In **confidentiality-centered multilevel security**, a **subject** at a **high** level may **not convey** information to a subject at a **lower** level **unless** that flow accurately reflects the will of an authorized user as revealed by an authorized **declassification**.

4.12.2024

Trusted Computing and Multilevel Security

11

11

## Bell-LaPadula Model

### A multilevel secure system for confidentiality must enforce

- **No read up**: A subject can only read an object of less or equal security level known as **simple security property (ss-property)**.

4.12.2024

Trusted Computing and Multilevel Security

12

12

## Bell-LaPadula Model

A multilevel secure system for confidentiality must enforce

- **No write down:** A subject can only write into an object of greater or equal security level known as **\*-property**.

- **ds-property:** An individual (or role) may **grant** to another individual (or role) **access** to a document based on the owner's discretion.

4.12.2024

Trusted Computing and Multilevel Security

13

13

## Bell-LaPadula Model

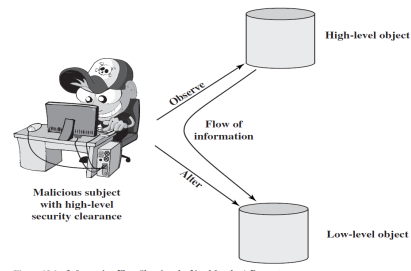

Figure 13.1 Information Flow Showing the Need for the \*-Property

- **ss-property** and **\*-property** provide confidentiality form of **mandatory access control**.
- **All of the three properties** provide **discretionary access control**.

4.12.2024

Trusted Computing and Multilevel Security

14

14

## Bell-LaPadula Model

Formal description of the model

Based on the **current state of the system** ( $b, M, f, H$ )

- **b:** current **access set** that is (**subject, object, access mode**) = ( $s, o, a$ )
- **M:** **Access matrix**. The matrix element  $M_{ij}$  records the access modes in which subject  $S_i$  is permitted to access object  $O_j$ .
- **f:** **Level function**. Assigns a security level to each subject and object.  $f_o(O_j)$  classification level of object  $O_j$ .  $f_s(S_i)$  security clearance of subject  $S_i$ .  $f_c(S_i)$  current security level of subject  $S_i$ .
- **H:** **Hierarchy**. A directed **rooted tree** whose **nodes** correspond to **objects** in the system.

4.12.2024

Trusted Computing and Multilevel Security

15

15

## Bell-LaPadula Model

Formal description of the model

Three BPL properties

- **ss-property:**  $(S_i, O_j, read)$  has  $f_c(S_i) \geq f_o(O_j)$
- **\*-property:**  $(S_i, O_j, append)$  has  $f_c(S_i) \leq f_o(O_j)$  and  $(S_i, O_j, write)$  has  $f_c(S_i) = f_o(O_j)$
- **ds-property:**  $(S_i, O_j, A_x)$  is current access (is in  $b$ ) where access mode  $A_x$  is recorded in  $(S_i, O_j)$  element of  $M$ .  $(S_i, O_j, A_x)$  implies  $A_x \in M[S_i, O_j]$

These properties are used to define **confidentiality of secure system**.

4.12.2024

Trusted Computing and Multilevel Security

16

16

## Bell-LaPadula Model

Formal definition of confidentiality

1. Current state ( $b, M, f, H$ ) is **secure** if and only if every element of  $b$  satisfies the **3 properties**.
2. The security **state** of the system is **changed** by any **operation** that causes a **change** any of **four components** of the system, ( $b, M, f, H$ ).
3. A **secure system** remains secure so long as any **state change** does **not violate** the **3 properties**.

BPL gives formal theorems

- **Theoretically possible** to prove system is **secure**
- In **practice**, usually **not possible**

4.12.2024

Trusted Computing and Multilevel Security

17

17

## Bell-LaPadula Model

BPL rules based on abstract operations

- **Get access:** **add a triple** ( $S, O, A$ ) to current access set  $b$ .
- **Release access:** **remove a triple** ( $S, O, A$ ) from the current access set  $b$ .
- **Change object level:** **change**  $f_o(O_j)$
- **Change current level:** **change**  $f_c(S_i)$
- **Give access permission:** **Add an access mode** to some entry of the access permission matrix  $M$ .
- **Rescind (cancel) access permission:** **Delete an access mode** from some entry of  $M$ .
- **Create an object:** **Attach an object** to the current tree structure  $H$  as a leaf.
- **Delete a group of objects:** **Detach from H an object and all other objects beneath it** in the hierarchy.

4.12.2024

Trusted Computing and Multilevel Security

18

18

## Bell-LaPadula Model

### BPL limitations

- No provision for **downgrading**
- Can only **edit** a file at **one security level** while reading at same or lower level
- **Classification creep** occurs if a **documents consolidates** from **many sources and levels**
- **Usability** and **implementation** problems

4.12.2024

Trusted Computing and Multilevel Security

19

19

## Biba Integrity Model

- BPL deals with **confidentiality** and is concerned with **unauthorized disclosure of information**, whereas, **Biba** model deals with **integrity** and is concerned with the **unauthorized modification of data**.
- In Biba, **data** are **visible** to users at **multiple** or all security **levels** but should **only** be **modified** by authorized agents.
- Each **subject** and **object** is assigned an **integrity level**, denoted as  $I(S)$  and  $I(O)$ .

4.12.2024

Trusted Computing and Multilevel Security

20

20

## Biba Integrity Model

### Access Modes

- **Modify**: write or update
- **Observe**: read
- **Execute**
- **Invoke**: communication from one subject to another

4.12.2024

Trusted Computing and Multilevel Security

21

21

## Biba Integrity Model

### The strict integrity policy rules:

- **Simple Integrity**: A subject can **modify** an object only if  $I(S) \geq I(O)$
- **Integrity confinement**: A subject can **read** an object only if  $I(S) \leq I(O)$
- **Invocation property**: A subject can **invoke** another subject only if  $I(S_1) \geq I(S_2)$

Figure 13.4 Contamination with Simple Integrity Controls  
4.12.2024 Trusted Computing and Multilevel Security

22

22

## Clark-Wilson Integrity Model

- **Clark-Wilson Model (CWM)** is aimed at **commercial** rather than military applications and it closely **models real commercial operations**.
- **The concepts of CWM**
  - **Well-formed transactions**: A **user** should **not manipulate** data arbitrarily, but only in constrained ways that **preserve the integrity**.
  - **Separation of duty among users**: Any person **permitted to create or certify** a well-formed transaction may **not be permitted to execute** it.

4.12.2024

Trusted Computing and Multilevel Security

23

23

## Clark-Wilson Integrity Model

- The **principle components** of the model:
  - **Constrained data items (CDIs)**: Subject to strict integrity controls
  - **Unconstrained data items (UDIs)**: Unchecked data items
  - **Integrity verification procedures (IVPs)**: Assure that all CDIs conform to some application specific model of integrity and consistency
  - **Transformation procedures (TPs)**: Transactions that change the set of CDIs from one consistent state to another.
- CWM **enforces integrity** by means of **certification** and **enforcement** rules of TPs.

4.12.2024

Trusted Computing and Multilevel Security

24

24

## Chinese Wall Model

- The model was developed for commercial applications in which conflict of interests can arise.

- Does not assign security levels -> not true multilevel security.
- Uses history of a subject's previous accesses to determine access control.

4.12.2024

Trusted Computing and Multilevel Security

25

## Chinese Wall Model

### The elements of the model

- Subjects:** users and processes
- Information:** corporate information with a hierarchy of three levels
  - Objects:** items of information, each concerning a single corporation
  - Dataset (DS):** all objects
  - Conflict of interest (CI) class:** all datasets whose corporations are in competition
- Access rules**

4.12.2024

Trusted Computing and Multilevel Security

26

## Chinese Wall Model

4.12.2024

Trusted Computing and Multilevel Security

27

## The Concept of Trusted Computing

- Early 1970s
- U.S. Department of Defense
- Initially did not gain a serious foothold in the commercial market
- Recently, the interest reemerged

4.12.2024

Trusted Computing and Multilevel Security

28

## The Concept of Trusted Computing

- Trust:** the extent to which someone who relies on a system can have a confidence that the system meets its specifications.
- Trusted system:** A system believed to enforce a given set of attributes to a stored degree of assurance.
- Trustworthiness:** Assurance that a system deserves to be trusted, such that the trust can be guaranteed in some convincing way, such as through formal analysis or code review.

4.12.2024

Trusted Computing and Multilevel Security

29

## The Concept of Trusted Computing

**Reference Monitors** is a controlling element in the hardware and OS of a computer that regulates the access of subjects to objects on the basis of security parameters of the subject and the object.

4.12.2024

Trusted Computing and Multilevel Security

30

## The Concept of Trusted Computing

### Properties of Reference Monitor

- **Complete mediation**: security rules are enforced on every access.
- **Isolation**: protected from unauthorized modification.
- **Verifiability**: prove that the reference monitor does complete mediation and isolation correctly.

4.12.2024

Trusted Computing and Multilevel Security

31

31

## The Concept of Trusted Computing Trojan Horse Example

4.12.2024

Trusted Computing and Multilevel Security

32

32

## Multilevel Security

- **Multilevel Secure (MLS)**: A class of system that has system resources at more than one security level and that permits concurrent access by users who differ in security clearance and need-to-know, but is able to prevent each user from accessing resources for which the user lacks authorization.
- **Multilevel Security for RBAC**: RBAC can implement BPL MLS rules given:
  - Security constraints on users
  - Constraints on read/write permissions
  - Read and write level role access definitions
  - Constraint on user-role assignment

4.12.2024

Trusted Computing and Multilevel Security

35

35

## Multilevel Security Database Security and MLS

### Read Access

- DBMS enforces simple security rule (no read up)
- Easy if classification granularity of all database
- **Inference problems** if have common granularity
  - Query on restricted data  
SELECT Ename FROM Employee WHERE Salary > 50K
  - **Solution** is to check access of all data
- **Problems with row granularity**
  - null response indicates restricted/empty result

4.12.2024

Trusted Computing and Multilevel Security

36

36

## Multilevel Security Database Security and MLS

### Write Access

- Enforce \*-security rule (no write down)
- Have **problem** if a **low clearance user** wants to insert a row with a **primary key** that already exists in a higher level row:
  - can **reject**, but user knows row exists
  - can **replace**, compromises data integrity
  - can **polyinstantiation** and insert multiple rows with same key, creates conflicting entries
- **Avoided** by using a **classification granularity** of database or table

4.12.2024

Trusted Computing and Multilevel Security

37

37

## Trusted Computing

- **Trusted Platform Module (TPM)**
  - An **industry standard** developed by **Trusted Computing Group**
  - A **hardware** module
  - At the **heart** of a hardware/software approach of trusted computing
  - **Trusted Computing (TC)** is used to refer such hardware and software
- **TC employs a TPM chip** in personal computer **motherboard** or a **smart card** or **integrated** into the main processor, together with **HW** and **SW** that in some sense has been **approved** or **certified** to work with the TPM.

4.12.2024

Trusted Computing and Multilevel Security

38

38

## Trusted Computing

- **Trusted Computing Approach:** TPM **generates keys** that it **shares** with **vulnerable components** that pass data around the system. The **keys** can be used to encrypt the **data flow** through the machine.
- **TPM works with TC-enabled** software to assure that data it receives are **trustworthy**.
- **Trusted Computing Services**
  - Authenticated boot
  - Certification
  - Encryption
